Peroxisome proliferator-activated receptor gamma ($PPAR\gamma$), a member of the intranuclear hormone receptor superfamily, which is typically exemplified by steroid hormone receptors and thyroid hormone receptors, plays an important role as a master regulator in the differentiation of adipocytes with its expression induced in the very early stage of adipocyte differentiation. $PPAR\gamma$ forms a dimer with the retinoid X receptor (RXR) by binding to a ligand, and binds to a responsive site of the target gene in the nucleus to

directly control (activate) transcription efficiency. In recent years, the possibility that 15-deoxy- $\Delta^{12,14}$ prostaglandin J₂, which is a metabolite of prostaglandin D₂, serves as an endogenous ligand for PPAR γ , has been suggested, and it has been shown that a class of insulin resistance enhancers, typically exemplified by thiazolidinedione derivatives, possess ligand activity for PPAR γ , and that its potency is proportional to its hypoglycemic action or adipocyte differentiation-promoting action (e.g., Cell, vol. 83, p. 803 (1995); The Journal of Biological Chemistry, vol. 270, p. 12953 (1995); Journal of Medicinal Chemistry, vol. 39, p. 655 (1996)).

In recent years, furthermore, it has been shown that 1) PPAR γ is expressed in cultured cells of human liposarcoma origin, whose proliferation is ceased by the addition of a PPAR γ ligand (Proceedings of the National Academy of Sciences of The United States of America, vol. 94, p. 237 (1997)), 2) nonsteroidal anti-inflammatory drugs, typically exemplified by indomethacin and fenoprofen, have PPAR γ ligand activity (e.g., The Journal of Biological Chemistry, vol. 272, p. 3406 (1997)), 3) PPAR γ is expressed at high levels in activated macrophages, with the transcription of a gene involved in inflammation inhibited by the addition of a ligand therefor (e.g., Nature, vol. 391, p. 79 (1998)), 4) PPAR γ ligands suppress the production of inflammatory cytokines (TNF α , IL-1 β , IL-6) by monocytes (e.g., Nature, vol. 391, p. 82 (1998)), 5) adipocyte hypertrophy, fat accumulation and expression of insulin resistance are suppressed in PPAR γ hetero deficient mouse (e.g., Molecular Cell (1999), vol. 4, p. 597), 6) PPAR γ ligand inhibits differentiation of 10T1/2 cell into adipocyte by PPAR γ agonist (e.g., Proceedings of The National

Academy of Sciences of The United States of America (1999), vol. 96, p. 6102), 7) PPAR γ ligand suppresses differentiation of 3T3-L1 cell into adipocyte by PPAR γ agonist (e.g., Molecular Endocrinology (2000), vol. 14, p. 1425) and the like.

An oral preparation, for instance, is produced by adding to the active ingredient, an excipient (e.g., lactose, saccharose, starch, D-mannitol etc.), a disintegrant (e.g., carboxymethylcellulose calcium etc.),
5 a binder (e.g., gelatinized starch, gum arabic, carboxymethylcellulose, hydroxypropylcellulose, polyvinylpyrrolidone etc.) or a lubricant (e.g., talc, magnesium stearate, polyethyleneglycol 6000 etc.), compression molding the obtained mixture, and, if

Injectons are produced by dissolving, suspending or emulsifying the active ingredient in an aqueous solvent (e.g. distilled water, physiological saline,
20 Ringer's solution etc.) or an oleaginous solvent (e.g. vegetable oils such as olive oil, sesame oil, cotton seed oil, corn oil etc.; propylene glycol etc.), together with a dispersant (e.g. polysorbate 80, polyoxyethylene-hardened castor oil 60 etc.),
25 polyethylene glycol, carboxymethylcellulose, sodium alginate etc.), a preservative (e.g. methylparaben, propylparaben, benzyl alcohol, chlorobutanol, phenol etc.), an isotonizing agent (e.g. sodium chloride, glycerol, D-mannitol, D-sorbitol, glucose etc.) and the
30 like. If desirable, additives such as a solubilizer (e.g. sodium salicylate, sodium acetate etc.), a stabilizer (e.g. human serum albumin etc.), a soothing agent (e.g. benzyl alcohol etc.) and the like, may be used.

The compound of the present invention has an

adipose tissue weight decreasing action, a hypoglycemic action, a hypolipidemic action, a hypoinsulinemic action, an insulin resistance improving action, an insulin sensitizing action, and a retinoid-related receptor
5 function regulating action.

The function regulating action here means both an agonist activity and an antagonist activity.

In addition, the term "retinoid-related receptor" used here is classified as a nuclear receptor, and is a
10 DNA-binding transcription factor whose ligand is a signal molecule such as oil-soluble vitamins etc., and may be any of a monomer receptor, a homodimer receptor and a heterodimer receptor.

Here, examples of the monomer receptor include
15 retinoid O receptor (hereinafter also abbreviated as ROR) α (GenBank Accession No. L14611), ROR β (GenBank Accession No. L14160), ROR γ (GenBank Accession No. U16997); Rev-erb α (GenBank Accession No. M24898), Rev-erb β (GenBank Accession No. L31785); ERR α (GenBank
20 Accession No. X51416), ERR β (GenBank Accession No. X51417); Ftz-FI α (GenBank Accession No. S65876), Ftz-FI β (GenBank Accession No. M81385); Tlx (GenBank Accession No. S77482); GCNF (GenBank Accession No. U14666) and the like.

25 Examples of the homodimer receptor include homodimers formed by retinoid X receptor (hereinafter also abbreviated as RXR) α (GenBank Accession No. X52773), RXR β (GenBank Accession No. M84820), RXR γ (GenBank Accession No. U38480); COUP α (GenBank Accession
30 No. X12795), COUP β (GenBank Accession No. M64497), COUP γ (GenBank Accession No. X12794); TR2 α (GenBank Accession No. M29960), TR2 β (GenBank Accession No. L27586); or HNF4 α (GenBank Accession No. X76930), HNF4 γ (GenBank Accession No. Z49826) and the like.

Examples of the heterodimer receptor include heterodimers which are formed by the above-mentioned retinoid X receptor (RXR α , RXR β or RXR γ) and one receptor selected from retinoid A receptor (hereinafter also
5 abbreviated as RAR) α (GenBank Accession No. X06614), RAR β (GenBank Accession No. Y00291), RAR γ (GenBank Accession No. M24857); thyroid hormone receptor (hereinafter also abbreviated as TR) α (GenBank Accession No. M24748), TR β (GenBank Accession No.
10 M26747); vitamin D receptor (VDR) (GenBank Accession No. J03258); peroxisome proliferator-activated receptor (hereinafter also abbreviated as PPAR) α (GenBank Accession No. L02932), PPAR β (PPAR δ) (GenBank Accession No. U10375), PPAR γ (GenBank Accession No. L40904); LXR α
15 (GenBank Accession No. U22662), LXR β (GenBank Accession No. U14534); FXR (GenBank Accession No. U18374); MB67 (GenBank Accession No. L29263); ONR (GenBank Accession No. X75163); and NUR α (GenBank Accession No. L13740), NUR β (GenBank Accession No. X75918) and NUR γ (GenBank
20 Accession No. U12767).

The compound of the present invention has an excellent ligand activity, in particular to retinoid X receptors (RXR α , RXR β , RXR γ) and to peroxisome proliferator-activated receptors (PPAR α , PPAR β (PPAR δ),
25 PPAR γ), among the above-mentioned retinoid-related receptors, and is useful as an agonist, a partial agonist, an antagonist or a partial antagonist.

Further, the compound of the present invention has an excellent ligand activity to peroxisome proliferator-activated receptors in heterodimer receptors formed from
30 a retinoid X receptor and a peroxisome proliferator-activated receptor (e.g., heterodimer receptors formed from RXR α and PPAR δ , heterodimer receptors formed from RXR α and PPAR γ etc.).

Accordingly, the retinoid-related receptor ligand of the present invention can be used preferably as a peroxisome proliferator-activated receptor ligand or a retinoid X receptor ligand.

5 Moreover, since the compound of the present invention has a superior antagonist activity against peroxisome proliferator-activated receptor γ (PPAR γ), it is free of a body weight increasing action. Furthermore, the compound of the present invention suppresses
10 differentiation of a preadipocyte to an adipocyte and decreases adipose tissue weight, based on its PPAR γ antagonistic activity. Due to the suppression, the compound of the present invention can improve insulin resistance and lowers the blood glucose level.

15 The compound of the present invention can be used as, for example, an agent for the prophylaxis or treatment of diabetes mellitus (e.g., type 1 diabetes mellitus, type 2 diabetes mellitus, gestational diabetes mellitus, etc.); an agent for the prophylaxis or

25 tolerance (IGT); an agent for the prophylaxis or treatment of obesity; an agent for the prophylaxis or treatment of hypertension; and an agent for preventing progress from impaired glucose tolerance to diabetes mellitus.

30 Regarding diagnostic criteria of diabetes mellitus, new diagnostic criteria were reported by the Japan Diabetes Society in 1999.

According to this report, diabetes mellitus is a condition wherein the fasting blood glucose level

(glucose concentration in venous plasma) is not less than 126 mg/dl, the 2-hour value (glucose concentration in venous plasma) of the 75 g oral glucose tolerance test (75 g OGTT) is not less than 200 mg/dl, or the non-
5 fasting blood glucose level (glucose concentration in venous plasma) is not less than 200 mg/dl. In addition, a condition that does not fall within the scope of the above definition of diabetes mellitus, and which is not a "condition wherein the fasting blood glucose level
10 (glucose concentration in venous plasma) is less than 110 mg/dl or the 2-hour value (glucose concentration in venous plasma) of the 75 g oral glucose tolerance test (75 g OGTT) is less than 140 mg/dl" (normal type), is called the "borderline type".

15 As regards the diagnostic criteria for diabetes mellitus, moreover, new diagnostic criteria were reported by ADA (American Diabetic Association) in 1997 and by WHO in 1998.

According to these reports, diabetes mellitus is a
20 condition where the fasting blood glucose level (glucose concentration in venous plasma) is not less than 126 mg/dl, and the 2-hour value (glucose concentration in venous plasma) of the 75 g oral glucose tolerance test is not less than 200 mg/dl.

25 In addition, according to the above reports, impaired glucose tolerance is a condition where the fasting blood glucose level (glucose concentration in venous plasma) is less than 126 mg/dl, and the 2-hour value (glucose concentration in venous plasma) of the 75
30 g oral glucose tolerance test is not less than 140 mg/dl and less than 200 mg/dl. Furthermore, according to the ADA report, a condition where the fasting blood glucose level (glucose concentration in venous plasma) is not less than 110 mg/dl and less than 126 mg/dl, is called

IFG (impaired fasting glucose). On the other hand, according to the WHO report, a condition of IFG (impaired fasting glucose) as such, where the 2-hour value (glucose concentration in venous plasma) of the 75 g oral glucose tolerance test is less than 140 mg/dl, is called IFG (impaired fasting glycemia).

The compound of the present invention can also be used as an agent for the prophylaxis or treatment of diabetes mellitus, borderline type, impaired glucose tolerance, IFG (impaired fasting glucose) and IFG (impaired fasting glycemia) as defined by the foregoing new diagnostic criteria. Furthermore, the compound of the present invention can be also used to prevent the progression of the borderline type, impaired glucose tolerance, IFG (impaired fasting glucose) or IFG (impaired fasting glycemia) to diabetes mellitus.

When the starting compound has an amino group, a carboxyl group, a hydroxy group, or a carbonyl group as a substituent in the respective reactions described above, a protective group in common use in peptide
30 chemistry and other fields may be introduced therein. The desired compound can be obtained by removing the protective group after the reaction, if necessary.

Examples of the amino-protecting group include those exemplified as the above-mentioned R^5 .

Examples of the carboxyl-protecting group include a C₁₋₆ alkyl group (e.g., methyl, ethyl, propyl, isopropyl, butyl, tert-butyl), a C₇₋₁₁ aralkyl group (e.g., benzyl), a phenyl group, a trityl group, a silyl group
5 (e.g., trimethylsilyl, triethylsilyl, dimethylphenylsilyl, tert-butyldimethylsilyl, tert-butyldiethylsilyl, tert-butyldiphenylsilyl), a C₂₋₆ alkenyl group (e.g., 1-allyl) and the like. These groups may be substituted by 1 to 3 halogen atoms (e.g.,
10 fluorine, chlorine, bromine, iodine), a C₁₋₆ alkoxy group (e.g., methoxy, ethoxy, propoxy), a nitro group and the like.

In addition, these protecting groups can be removed by a method known *per se*, e.g., the method
20 described in Protective Groups in Organic Synthesis, published by John Wiley and Sons (1980). For example, methods employing an acid, a base, ultraviolet rays, hydrazine, phenylhydrazine, sodium N-methyldithiocarbamate, tetrabutylammonium fluoride,
25 palladium acetate, a trialkylsilyl halide (e.g., trimethylsilyl iodide, trimethylsilyl bromide etc.) or the like, the reduction method, and the like may be used.

When Compound (I) contains an optical isomer, a stereomer, a position isomer or a rotation isomer, these
30 isomers are also encompassed as Compound (I) and can be each obtained as a single substance by means of a method known *per se* of synthesis or separation. For example, when an optical isomer is present in Compound (I), the optical isomer separated from said compound is also

included in Compound (I).

Optical isomers can be produced by a method known *per se*. Specifically, optical isomers are obtained by using an optically active synthesis intermediate, or
5 optically resolving a racemate of the final product by a conventional method.

Examples of the method of optical resolution include methods known *per se*, such as the fractional recrystallization methods, the chiral column methods and
10 the diastereomer methods.

1) Fractional recrystallization method

A method wherein a salt is formed between a racemate and an optically active compound [e.g., (+)-mandelic acid, (-)-mandelic acid, (+)-tartaric acid, (-)
15)-tartaric acid, (+)-1-phenethylamine, (-)-1-phenethylamine, cinchonine, (-)-cinchonidine, brucine etc], which salt is separated by fractional recrystallization etc., and, if desired, subjected to a neutralization process, to yield a free optical isomer.

20 2) Chiral column method

A method wherein a racemate or a salt thereof is applied to a column for optical isomer separation (chiral column). In the case of liquid chromatography, for example, optical isomers are separated by adding a
25 mixture of the optical isomers to a chiral column such as ENANTIO-OVM (produced by Tosoh Corporation) or CHIRAL series produced by DAICEL CHEMICAL IND., and developing it in water, various buffers (e.g., phosphate buffer), an organic solvent (e.g., ethanol, methanol, isopropanol,
30 acetonitrile, trifluoroacetic acid, diethylamine etc.), or a solvent mixture thereof. In the case of gas chromatography, for example, a chiral column such as CP-Chirasil-DeX CB (produced by GL Science) is used to separate optical isomers.

3) Diastereomer method

A method wherein a racemate mixture and an optically active reagent are chemically reacted to yield a diastereomer mixture, which is then subjected to
5 ordinary means of separation (e.g., fractional recrystallization, chromatography etc.) to obtain single substances, which are subjected to a chemical reaction such as a hydrolysis reaction to cut off the optically active reagent moiety, whereby the desired optical
10 isomer is obtained. For example, when Compound (I) has hydroxy or primary or secondary amino in the molecule thereof, said compound, an optically active organic acid (e.g., MTPA [α -methoxy- α -(trifluoromethyl)phenylacetic acid], (-)-menthoxyacetic acid) and the like may be
15 subjected to a condensing reaction to yield a diastereomer of an ester or amide, respectively. On the other hand, when Compound (I) has a carboxyl group, said compound and an optically active amine or an alcohol reagent may be subjected to a condensing reaction to
20 yield a diastereomer of an amide or ester, respectively. The diastereomer thus separated is converted to an optical isomer of the original compound by subjecting it to an acid hydrolysis or a basic hydrolysis reaction.

20 To a mixture of ethyl 4-(4-([4-([4-[(E)-2-(2-ethyl-1,3-thiazol-4-yl)ethenyl]-1-(2-methylphenyl)-1H-pyrazol-3-yl]oxy)methyl)-2-methoxyphenoxy)methyl)-5-methyl-1,3-oxazol-2-yl)phenyl]acetate (120 mg), tetrahydrofuran (2 mL) and ethanol (2 mL) was added 1N
25 aqueous sodium hydroxide solution (0.9 mL), and the mixture was stirred at 50°C for 1 hr. To the reaction mixture were added 1N hydrochloric acid (0.9 mL) and water, and the mixture was extracted with ethyl acetate. The organic layer was washed with saturated brine, dried
30 over anhydrous magnesium sulfate and concentrated. The residue was washed with acetone-diethyl ether to give 4-(4-([4-([4-[(E)-2-(2-ethyl-1,3-thiazol-4-yl)ethenyl]-1-(2-methylphenyl)-1H-pyrazol-3-yl]oxy)methyl)-2-methoxyphenoxy)methyl)-5-methyl-1,3-oxazol-2-

yl)phenyl]acetic acid as colorless amorphous form (81 mg, yield 70%).

Formulation Example 1 (production of capsules)

	(1) Compound of Example 1	30 mg
10	(2) Microcrystalline cellulose	10 mg
	(3) Lactose	19 mg
	(4) Magnesium stearate	1 mg
	total	60 mg

(1), (2) and (3) and (4) are admixed and filled in
15 a gelatin capsule.

Formulation Example 2 (production of tablets)

	(1) Compound of Example 1	30 g
	(2) Lactose	50 g
	(3) Corn starch	15 g
20	(4) Carboxymethylcellulose calcium	44 g
	(5) Magnesium stearate	1 g
	1000 tablets	total 140 g

The entire amount of (1), (2) and (3) and 30 g of (4) are admixed with water. After drying in vacuo, the
25 mixture is granulated. Thereto are added 14 g of (4) and 1 g of (5) and the mixture is tableted with a tableting machine. In this way, 1,000 tablets containing 30 mg of the compound of Example 1 per tablet are obtained.

Industrial Applicability

30 The compound of the present invention is superior in an adipose tissue weight decreasing action, a hypoglycemic action, a hypolipidemic action, a hypoinsulinemic action, an insulin resistance improving action, an insulin sensitizing action, and a retinoid-

related receptor function regulating action, and can be used as, for example, an agent for the prophylaxis or treatment of diabetes mellitus (e.g., type 1 diabetes mellitus, type 2 diabetes mellitus, gestational diabetes mellitus, etc.); an agent for the prophylaxis or treatment of hyperlipidemia (e.g., hypertriglyceridemia, hypercholesterolemia, hypo-high-density-lipoproteinemia, postprandial hyperlipemia etc.); an agent for improving insulin resistance; an insulin sensitizer; an agent for the prophylaxis or treatment of impaired glucose tolerance (IGT); an agent for the prophylaxis or treatment of obesity; an agent for the prophylaxis or treatment of hypertension; and an agent for preventing progress from impaired glucose tolerance to diabetes mellitus.
